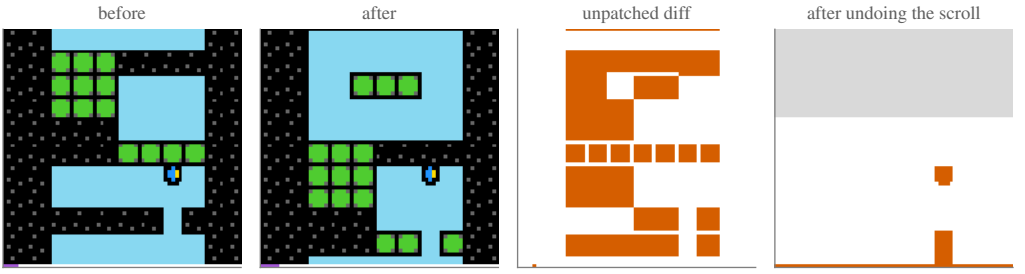
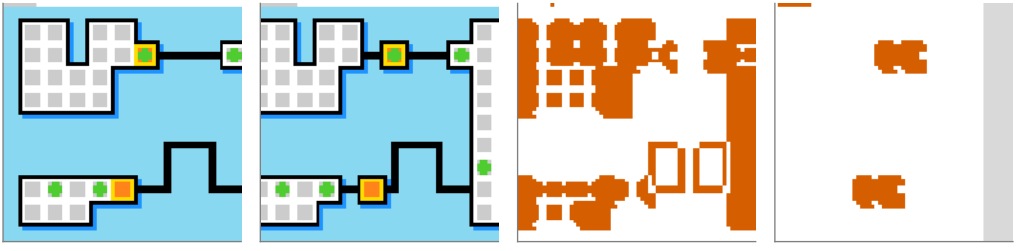
A bp35, level 1: replay frames 4 and 5

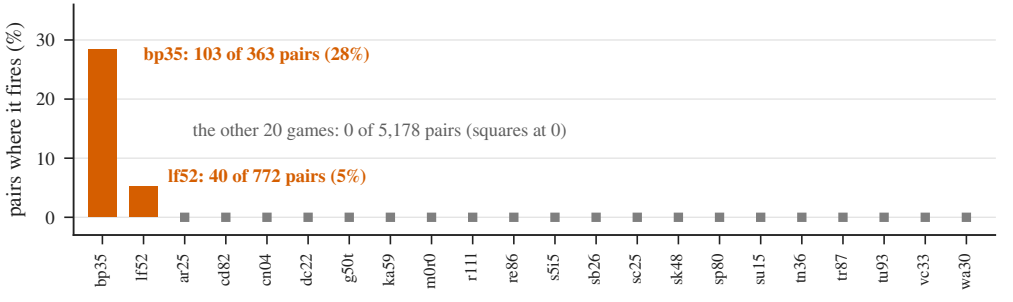


B lf52, level 3: replay frames 58 and 59



Diff images: orange = changed cell, gray = cell scrolled into view (the patched module counts it as changed).

C Detector firing on every changed same-level frame pair, 22 human replays



Pairs are consecutive replay frames on the same level with a changed frame (6,313 in all; the detector stays silent on 6,170).
Two frame pairs and one replay per game: this shows what the detector does on human play, not that the model plays better.
